## Enable Video Call-Back for Webex Meetings

You can join Personal Room meetings and scheduled meetings by having the meeting call you on a designated video system.

A video address connects your video system or application to a Webex scheduled meeting or a meeting host's Personal Room. To join or start a scheduled meeting, dial the video address.

You own a virtual conference room that has three permanent addresses—Web URL, video address, and call-in phone numbers. You can dial the video address to start a meeting in your room at any time. People can join you in your Personal Room by dialing the same video address every time.

1. In your Preferences, select Video Systems.
2. Add the details for a maximum of five video addresses.

The video system you select as default is used in your meetings as the video call-back option.

3. During a meeting, in the Audio and Video Connection dialog box the Quick Start page, select Call My Video System. Your default address is listed, but you can also manually enter a video system address.

When joining from a desktop on a WBS32 or later site, the meeting application detects nearby Proximity-enabled video systems and prepopulates the video address for you.

You will receive a call from the meeting to your video system.
